

During the second sprint of this milestone, team member Jia attempted to integrate circleCI into the group project. He did this by making a private copy of the project repository and adding circleCI to the private copy.

	Success	welcome	circleci-project-setup 6b488dd	2d ago	7s				

From the screenshots shown above, other than the first build, which used a hello world config.yml file, every other build failed. This was due to Jia not understanding how to configure the .yml file properly. Builds from 8 to 14 were built solely for the trial and error regarding the configuration of the .yml file. After the 14th build, Jia gave up on configuring it and left it as is for the rest of the sprint.
